Presentation

COMPLETE

CHIEF COMPLAINT	left knee pain, difficulty performing functional activities and difficulty walking along with ankle and back pain during prolonged walking
HISTORY	The patient was involved in a road traffic accident resulting in a left tibial condyle fracture and an avulsion ACL tear eight months ago. Open reduction and internal fixation was performed by Dr. Hemant Kalyan, followed by four to six weeks of non-weight bearing and subsequent progressive loading.
DURATION	eight months

Objective measurements

DEGREES

TEST	LEFT	RIGHT	DELTA
Knee flexion	124	130	-6
Knee extension	20	5	+15
Hip internal rotation	45	45	—
Ankle dorsiflexion	4.5	12	-7.5

Subjective findings

Pain	Left knee pain with difficulty performing functional activities and difficulty walking along with ankle and back pain during prolonged walking following surgery.
Surgical scar	Healed surgical scar on the medial aspect of the knee, restricted and painful knee flexion on over pressure, restricted extension, swelling
Patellar mobility	Patellar mobility was good.
Hip range	Left hip extension was restricted.
Ankle range	Ankle dorsiflexion of 4.5° on the left compared with 12° on the right.

Treatment goals

6 TARGET DATES NOT STATED — ADD THEM HERE

Restoring the extension	Not stated
Improving knee stability	Not stated
Strengthening the quadriceps	Not stated
Improving functional lower limb musculature	Not stated
Improving ankle mobility	Not stated
Activating the posterior chain	Not stated

Plan

RECOMMENDATION	Physiotherapy once weekly for four sessions
PATIENT ADVICE	Not stated in this recording

Fields requiring review

These fields were left blank because the recording did not cover them, or because a value could not be traced back to it. They were not inferred. Complete them by hand before filing this record.
